LAB REPORT

Artificial Intelligence (23CS5PCAIN)

Submitted by

Madhu Sarika (1BM22CS140)

in partial fulfillment for the award of the degree of

BACHELOR OF ENGINEERING

in

COMPUTER SCIENCE AND ENGINEERING

B.M.S. COLLEGE OF ENGINEERING

(Autonomous Institution under VTU)

BENGALURU - 560019

Academic Year 2024 - 25 (odd)

B.M.S. College of Engineering

Bull Temple Road, Bangalore 560019

(Affiliated To Visvesvaraya Technological University, Belgaum)

Department of Computer Science and Engineering

CERTIFICATE

This is to certify that the Lab work entitled "Artificial Intelligence (23CS5PCAIN)" carried out by **MADHU SARIKA (1BM22CS140),** who is bonafide student of **B.M.S. College of Engineering.** It is in partial fulfilment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum. The Laboratory report has been approved as it satisfies the academic requirements of the above-mentioned subject and the work prescribed for the said degree.

Prameetha Pai	Dr. Kavitha Sooda
Assistant Professor	Professor & HOD
Department of CSE, BMSCE	Department of CSE, BMSCE

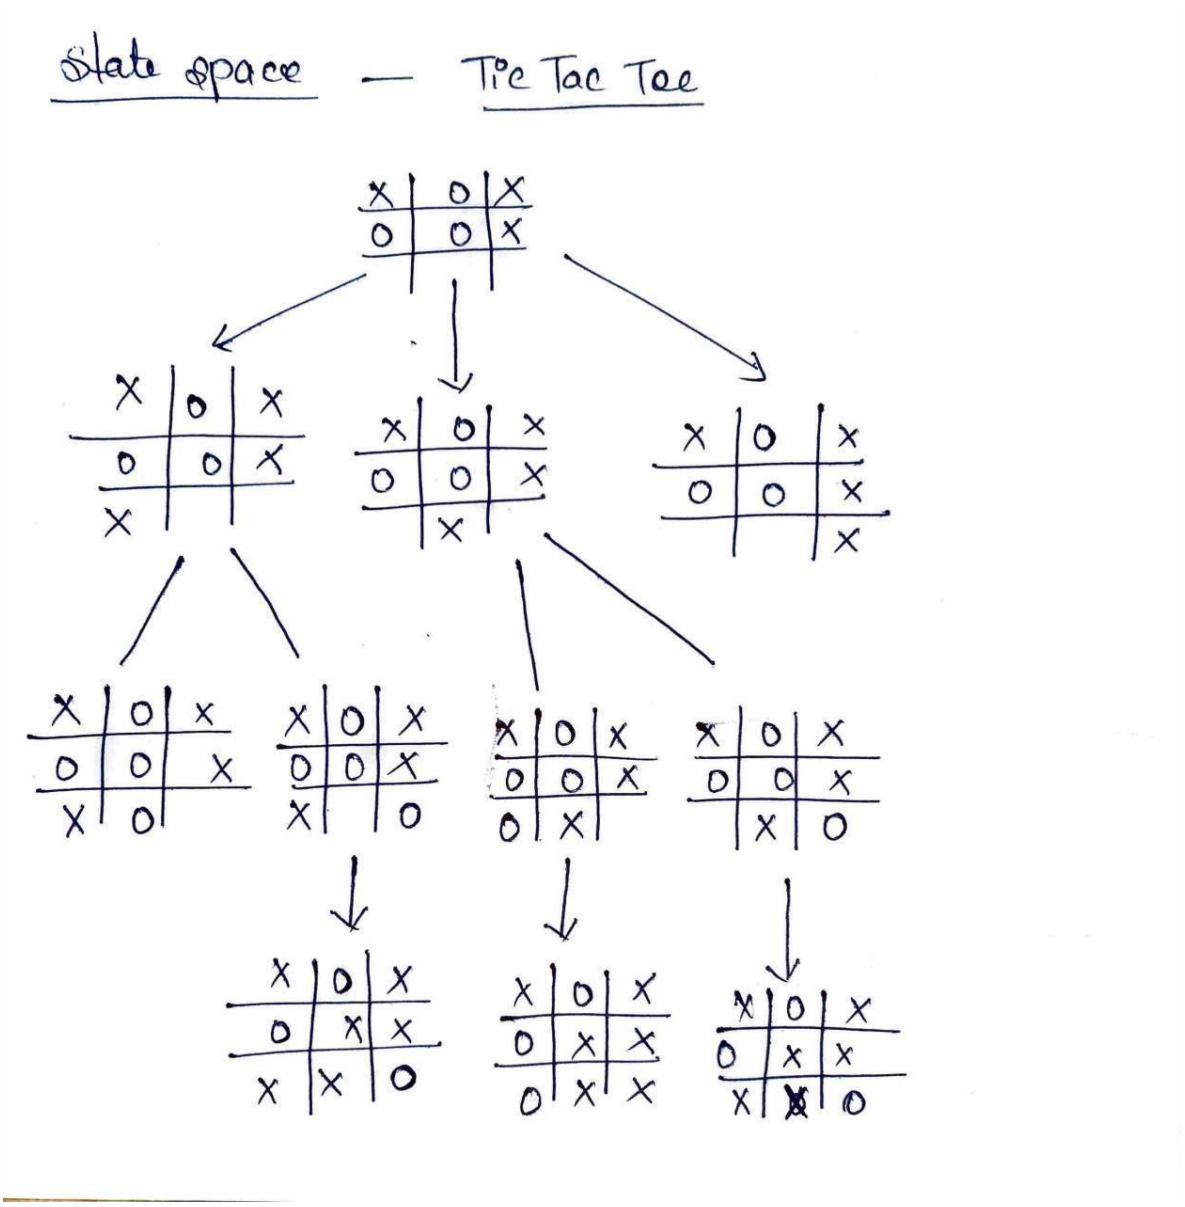
LAB PROGRAM 1

Implement Tic Tac Toe game.



Lab - 2 Tictac Toe 1|10|24

Algorithm:

1. Intialize game board – Create a 3×3 board filled with empty spaces.
2. Print the board positions and the corresponding index numbers (0-8) for user input.
3. Set human player as "x" and the computer as "0".
4. Game loop:

   Repeat until the game ends (win or draw)

   Print current board state.

   //check current player

   if the current player is "x" (human), prompt the user to input their move.

   For validating i/p, ensure that user has entered b/w 0 and 8 and also check that the selected cell is not already occupied, if invalid prompt again.

   if the current player is "0" (computer) generate a list of available moves and implement the strategy to choose the best move, win move, block move or random.

5. Place the current player's mark either 0 or x in the selected cell.
6. Call check_winner(board) to check for the winner.
7. Call isboard_full(board) to check for the draw and then exit the loop.
8. Then player can switch from x to 0.

Code:

```
import random

def print_board(board):
    for row in board:
        print(" | ".join(row))
        print("-" * 9)

def check_winner(board):
    for row in board:
        if row[0] == row[1] == row[2] != " ":
            return row[0]

    for col in range(3):
        if board[0][col] == board[1][col] == board[2][col] != " ":
            return board[0][col]

    if board[0][0] == board[1][1] == board[2][2] != " ":
        return board[0][0]
    if board[0][2] == board[1][1] == board[2][0] != " ":
        return board[0][2]

    return None

def is_board_full(board):
    return all(cell != " " for row in board for cell in row)

def get_available_moves(board):
    return [(i, j) for i in range(3) for j in range(3) if board[i][j] == " "]
```

```
def tic_tac_toe():
    board = [[" " for _ in range(3)] for _ in range(3)]
    current_player = "X" # Human player
    computer_player = "O"

    print("Welcome to Tic-Tac-Toe!")
    print("Board positions:")
    print(" 0 | 1 | 2")
    print("...........")
    print(" 3 | 4 | 5")
    print("...........")
    print(" 6 | 7 | 8")

    while True:
        print_board(board)

        if current_player == "X":
            move = input(f"Player {current_player}, enter your move (0-8): ")
            try:
                move = int(move)
                row, col = divmod(move, 3)
                if board[row][col] != " ":
                    print("Invalid move. Cell already occupied. Try again.")
                    continue
            except (ValueError, IndexError):
                print("Invalid input. Please enter a number between 0 and 8.")
                continue
        else:
            # Computer's turn
            available_moves = get_available_moves(board)
```

```
            row, col = random.choice(available_moves)
            print(f"Computer ({computer_player}) chooses: {row * 3 + col}")

        board[row][col] = current_player
        winner = check_winner(board)

        if winner:
            print_board(board)

```

Output:

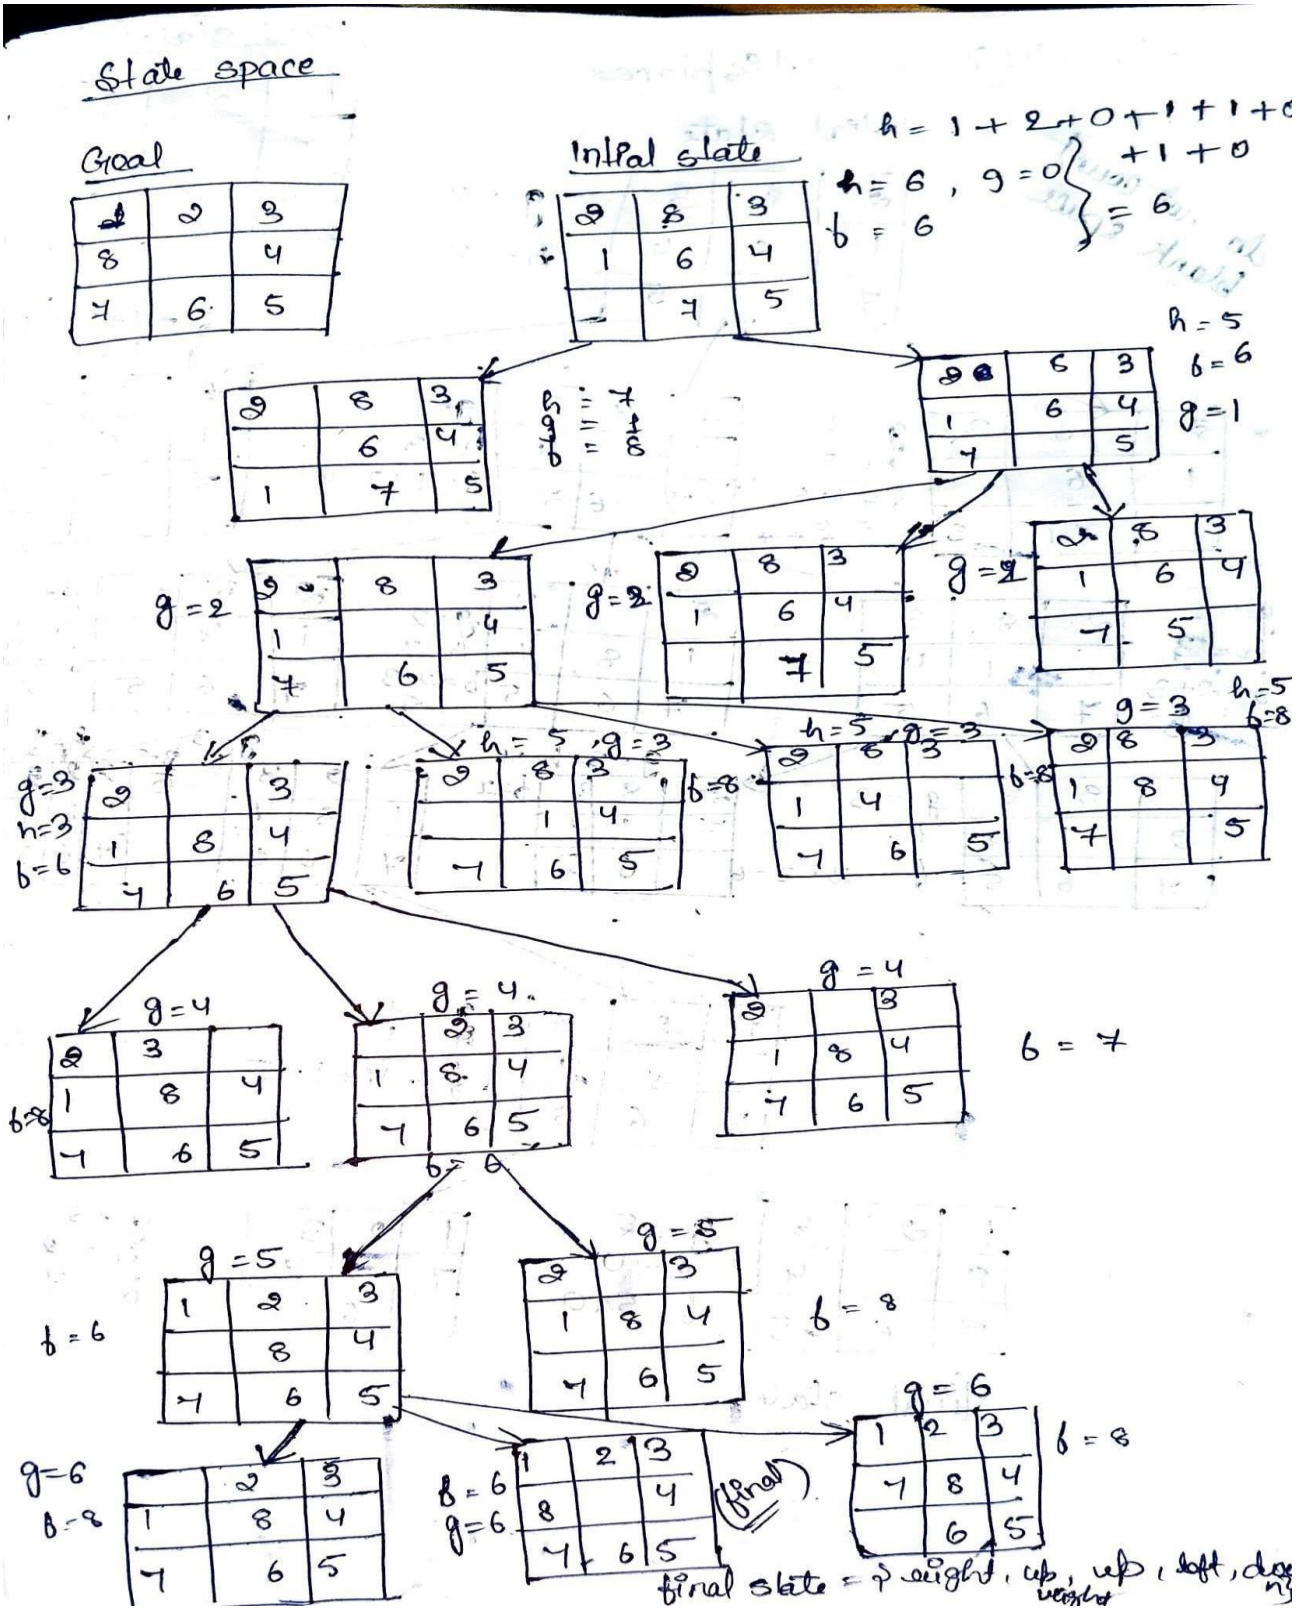
The vacuum cleaner is at (0, 0) and it is dirty. Cleaning.
The vacuum cleaner is at (0, 1) and it is clean. Moving.
The vacuum cleaner is at (1, 0) and it is dirty. Cleaning.
The vacuum cleaner is at (1, 1) and it is dirty. Cleaning.
All locations are clean. The vacuum cleaner is finished.
Start coding or generate with AI.

LAB PROGRAM 5

Implement A* search algorithm.

Heuristic – Manhattan



15/10/24

Heuristic : Manhattan Algorithm

1. Create a puzzle class to represent the current state of the 8 puzzle. This includes: ~~a~~ current board configuration, pointer to the parent state and move taken to reach this state. g → cost of the start node to the current node (depth of node) and h → the heuristic value (Manhattan distance)

   Total cost (f) = g+h

2. Initialize an open list (priority queue) and a closed set (visited states)
3. Calculate the heuristic for the start state and add it to open list.
4. When the open list is non empty, pop the state with lowest f(n) from the open list.
5. If the current state is the goal, trace the path back to the start and return the moves.
6. Mark the current state as explored and add it to closed set.
7. For each neighbouring state, generate new states and calculate g(n), h(n), and f(n).
8. If the neighbour hasn't been explored add it to the open list.
9. If the goal is found, return the solution path or if the open list has no solution, return that no solution exists.

```
import heapq

goal_state = [[1, 2, 3],
              [8, 0, 4],
              [7, 6, 5]]

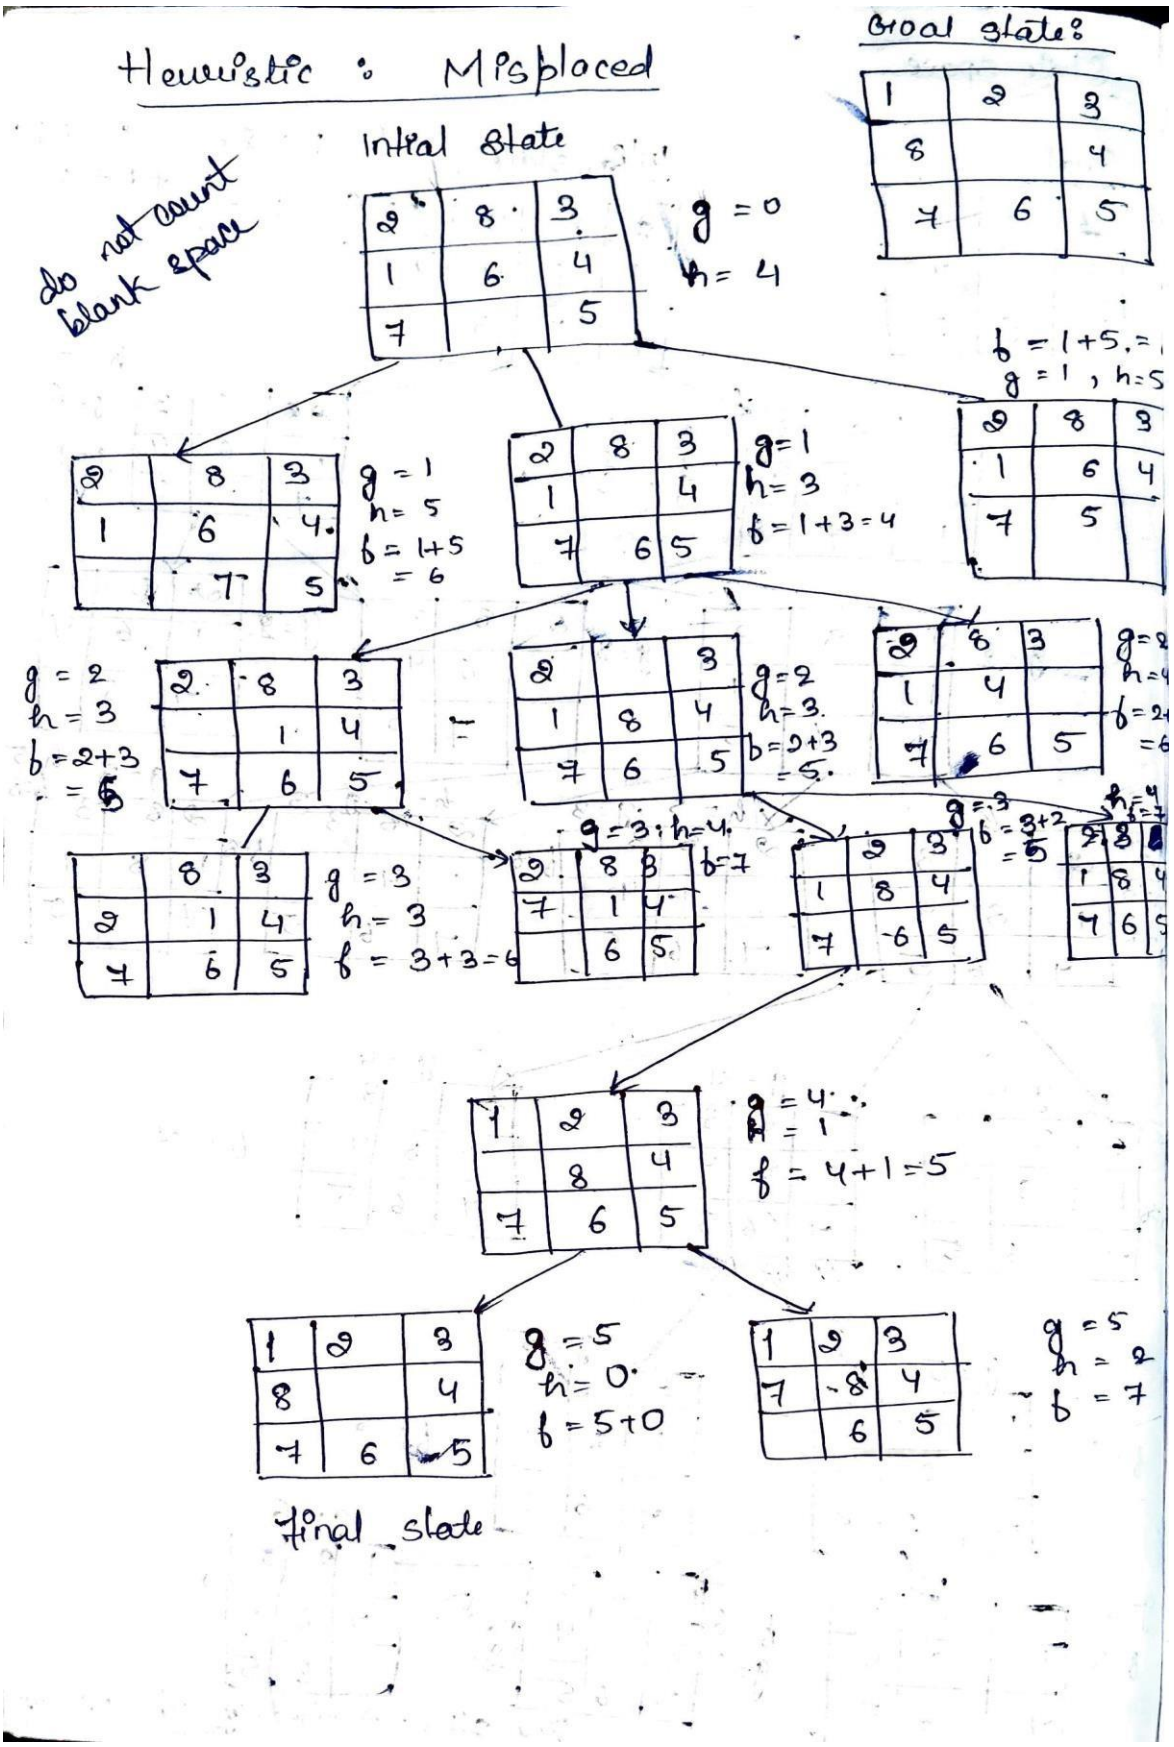
Heuristic – Mismatched Tiles



Algorithm

1) Create the start node with intial state and set its cost = 0.
2) Create an empty priority queue called frontier and add the start node to it.
3) Create an empty set called explored set to store visited states

while frontier is not empty,

4) pop the node with the lowest cost from the frontier, (this is the current node).
5) If the current node's state matches the goal state, return the path to this node.
6) Add the current node's state to the explored set.

for each neighbour of currentnode:

7) Calculate the depth g as the current node's depth + 1.
8) Calculate the heuristic h by counting the number of misplaced in the neighbour's state.
9) Calculate the total cost f = g + h.
10) If the neighbour's state is not in explored
   (i) Set the neighbor's cost to f and
   (ii) add the neighbour to the frontier.
   else, Add neighbour's state to the explored set.
11) If no sol found, return failure.

```

Questions

1. Unify $P(x,a,b)$ and $P(y,z,b)$:

   Step 1: Compare the predicates, both are P so they are compatible.

   Step 2: Match arguments

   Unifier: $\{x=y, z=a\}$

2. Unify $\forall x\, P(x, f(y))$ and $P(z, f(a))$

   Substitution $= \Sigma$. First argument: second argument: $f(y)$ and $f(a)$ the function f are same so, $y=a$.

   Unifier:

   $\{x=z, y=a\}$

First Order Logic

1. Translate FOL and vice versa

① "John is a human".
Human(John)

② "Every human is mortal".
$\forall x \, Human(x) \Rightarrow Mortal(x)$

③ "John loves Mary"
Loves(John, Mary)

④ "There is someone who loves mary."
$\exists x \, Loves(x, Mary)$

⑤ "All dogs are animals".
$\forall x \, Dogs(x) \Rightarrow Animals(x)$

⑥ "Some dogs are brown".
$\exists x \, dog(x) \wedge brown(x)$

2. Translation of formal statements into English

(a) $\exists x [H(x) \wedge \forall y (\neg M(x,y)) \wedge U(x)]$

$M(x,y)$ means 'x is married to y.
$H(x)$ is a man
$U(x)$ means x is unhappy
$\forall y (\neg M(x,y))$:
x is not married to any y.
$U(x)$: is unhappy

$\Rightarrow$ "There exist a man who is not married to anyone and is unhappy."

(b) $\exists z [P(z,x) \wedge S(z,y) \wedge W(y)]$

$P(z,x)$: z is a parent of x.
$S(z,y)$: z and y are siblings.
$W(y)$: y is a woman

"There exist a person who is a parent of x, is a a sibling of y and y is a woman".

print optimal_value
print optimal_path
```

Output

The optimal value is : 10

The optimal path is : A → B → D → H
